Vetwise Clinic User Guide

Administrator and veterinarian instructions for the fictional training website

Use this guide to operate the local demonstration safely. It is not a production medical, payment, or identity system. Never enter real client, patient, health, payment, password, invitation-code, or database data.

Role	What the role can do
Administrator	Add patients, book and manage clinic-wide visits, view billing, mark an open invoice paid.
Veterinarian	View assigned future visits, search patients, confirm only assigned pending visits.

1. Start and sign in

From the web folder run npm install once, then npm run dev. Open http://localhost:3000. Sign in with your individual staff email and password.

New staff registration requires the correct private invitation code. The clinic owner configures it on the server. Do not place invitation codes in files or share a signed-in browser session.

Sessions last up to 12 hours and end after sign-out or a server restart. If the app reports an expired session, sign in again.

- If registration is unavailable, ask the clinic owner to configure the appropriate invitation code.
- Do not edit staff-accounts.json or clinic-store.json manually.

2. Dashboard and role boundaries

Administrators see clinic-wide summary cards, the seven-day agenda, every appointment, patient records, and billing. Selecting a day changes the administrator dashboard list.

Veterinarians see their own future active worklist. They cannot see another doctor’s schedule, access billing, create clinic-wide bookings, or cancel visits.

The server checks permissions for every request. Hiding a control in the browser is helpful, but it is not the security boundary.

- Use the sidebar to move between Dashboard, Patients, Appointments, and Billing.
- Use the patient search and status filters to find records quickly.

3. Administrator workflow

Choose New patient, complete patient name, species, breed, and owner name, then save. A new patient has no last-visit date until an appointment is completed.

Choose New appointment, select a patient and veterinarian, choose date and time, enter a short reason, then submit. A new booking starts as Pending confirmation for the assigned veterinarian.

Appointments are 30 minutes. The system checks the real calendar date, Monday-Saturday clinic hours, five-minute increments, past times today, and overlapping patient or veterinarian visits.

- Permitted start times are 08:00 through 17:30.
- Administrators can cancel an active visit.
- Administrators can complete confirmed or legacy scheduled visits after their start time.

4. Veterinarian workflow

Read the dashboard worklist after sign-in. It lists every future active appointment assigned to your linked veterinarian profile, including appointments beyond the next seven days.

A Pending confirmation visit assigned to you has a Confirm visit button. Confirm only visits you accept. The status becomes Confirmed and the administrator can later complete it after the appointment time.

Completed and Cancelled visits are final in this demo. A Scheduled visit is a legacy seeded record that remains active.

- Pending confirmation: administrator booked the visit and awaits your response.
- Confirmed: accepted by the assigned veterinarian.
- Completed or Cancelled: final status, with no further transition.

5. Billing, errors, and safe use

Administrators use Billing to filter invoices and mark an open invoice paid. The web demonstration does not collect payment amount, method, receipt, refund, or card data.

When a request fails, read the message. It normally identifies an incomplete field, date or time rule, appointment overlap, or invalid status transition. Correct the input and try again.

The web demonstration and Oracle SQL project are separate. Web actions update only local JSON demo data; they do not update Oracle.

- Keep all information fictional.
- If the page cannot load, confirm the server is running and refresh.
- Report incorrect records to the clinic owner instead of editing local JSON files.
